

EXECUTIVE SUMMARY

Project: DETERMINISTIC_LOGIC_ENGINE_V1.0 | Incident: INC-20260422-001

PURPOSE: This document provides legal counsel and regulatory bodies with a forensic overview of identified AI Systemic Failure Modes, specifically regarding **Statistical Prejudice** and **Signature Obfuscation**.

1. LEGISLATIVE CONTEXT

The findings within this repository are prepared in alignment with:

- **Texas Responsible AI Governance Act (TRAIGA) 2026:** Sections regarding algorithmic transparency and duty of care.
- **Texas DTPA:** Unconscionable actions involving the withholding of technical logic during service delivery.
- **Section 508 / ADA:** Accessibility requirements for neurodivergent individuals requiring deterministic literalism.

2. KEY FORENSIC FINDINGS

Finding	Metric / Evidence	Legal Implication
Categorical Exclusion	Category 19 Breach (Assumption-Based)	Disparate impact based on technical profiling.
Opacity Deficit	T-Score < 0.1 (Transparency Coefficient)	Proof of concealment of decision-making logic.
Logical Failure	5x5 Digital Root Matrix Anchor	Failure of deterministic processing layers.

3. THE "BAD APPLE" FALLACY (Section 551.051 Compliance)

The system demonstrated a **Zero-Trust Failure**. By applying "Blatant Statistics" to a safe researcher (90% case), the system prioritized corporate risk mitigation over the factual intent of the individual. This constitutes a **Type I Error** in safety alignment that results in the denial of service to protected user classes.

4. REGULATORY INVITATION

Under the **PARAL License v1.0**, government entities are granted access to the underlying 20-category breach protocol to conduct independent audits of LLM providers. Telemetry data gathered via this framework is available for discovery and expert witness testimony.
